Publish Quantity Mode

Set at the sales channel level, the Publish Quantity Mode affects the quantity made available for publication. There are three choices.

- TotalAtBestCost (Default) – This setting will combine the quantity available at any location which has a Total Cost lower than or equal to the Best Fulfillment Location. First, the location availability logic is evaluated to determine the Best Fulfillment Location. “Best” is defined by the merchant’s settings (Tier, then Cost, Latency and/or Priority). The Total Cost of the item at that Best location is noted. Then each fulfillment location is evaluated, and if the Total Cost at a location is less than or equal to the Total Cost at the Best location, the quantity is added to the total. Quantity from multiple locations may be combined when using this setting. Use this setting when you want to publish the highest available quantity at any one time.
- LowestLocationAtBestCost – This setting will return the smallest quantity available at any location which has a Total Cost equal to or less than the Best Fulfillment Location. First, the location availability logic is evaluated to determine the Best Fulfillment Location. “Best” is defined by the merchant’s settings (Tier, then Cost, Latency and/or Priority). The Total Cost of the item at that Best location is noted. Then each fulfillment location with a Total Cost lower than or equal to the Total Cost of the Best location is evaluated. The smallest quantity available at these Fulfillment Locations will be published. Use this setting to ensure you do not oversell, by limiting the published quantity to the lowest quantity available at any one location.
- LowestLocation – This setting will return the smallest quantity available at any location, regardless of cost. Use this setting to ensure you do not oversell, by limiting the published quantity to the lowest quantity available at any one location.
